1 Introduction

The Tutor Availability Platform is an Object Oriented Programming project developed to connect students with tutors in an efficient and structured manner. The system allows tutors to create profiles, define their subject expertise, manage available time slots, and handle session requests. Students can browse tutor profiles, search tutors by subject, request sessions, and keep track of their scheduled tutoring sessions.

This project goes beyond a basic management system by incorporating smart features such as tutor recommendation and ranking, waitlist management, and automatic slot reassignment after cancellations. These enhancements make the system more practical, intelligent, and user-oriented.

2 Project Objective

The main objective of this project is to design and implement a tutoring platform using proper Object Oriented Programming principles. The system aims to:

- manage tutors and students through a well-structured class hierarchy
- allow students to search tutors according to their academic needs
- support tutor availability and session booking
- prevent overlapping bookings through conflict detection
- manage waitlists when tutor slots are already occupied
- automatically assign cancelled slots to the next eligible student in the waitlist
- recommend and rank tutors based on subject match, rating, and availability

3 Object Oriented Programming Concepts Used

3.1 Inheritance

Inheritance allows a derived class to acquire the attributes and methods of a base (parent) class, promoting code reuse and a logical hierarchy. A base class User holds common attributes shared by all system users — userId, name, and contactInfo — along with their getters and setters. Both Tutor and Student inherit from User using public inheritance.

3.2 Polymorphism

Polymorphism means "many forms" — the same function name behaves differently depending on the object calling it. In C++, this is achieved through **virtual functions** and **function overriding**. **In this project:** The function viewProfile() is declared as a **pure virtual function** in the base class User. Both Tutor and Student override it with their own implementation, displaying different information depending on the object type.

3.3 Encapsulation

Encapsulation means bundling data (attributes) and the functions that operate on that data together inside a class, and restricting direct access to internal details using access specifiers (private, protected, public). All sensitive data is declared private inside every class. For example, in the Tutor class, attributes like subjects, rating, experienceYears, and availableSlots are private. No outside code can directly modify them. Instead, controlled access is provided through public getter and setter functions like getRating(), getName(), and setContactInfo().

3.4 Abstraction

Abstraction means hiding complex internal implementation details and exposing only what is necessary to the outside world. The user of a class does not need to know *how* it works internally, only *what* it does. The User class is made **abstract** by declaring viewProfile() as a pure virtual function (= 0). This means User cannot be instantiated directly — it serves only as a blueprint. This enforces a contract: any class that inherits from User *must* provide its own viewProfile() implementation.

3.5 Exception Handling

Exception handling in C++ uses try, catch, and throw to detect and respond to runtime errors gracefully, instead of letting the program crash. Exception handling is used to protect against invalid operations such as booking a session with a non-existent tutor, student, or slot ID. Instead of the program crashing silently, a descriptive error is thrown and caught.

4 System Overview

The system is based on the following main classes:

- User

- Tutor
- Student
- Session
- TimeSlot
- Waitlist
- RecommendationEngine
- Platform

The Platform class acts as the central controller. It stores the data of tutors, students, and sessions, and coordinates major system operations such as searching, booking, cancelling, and displaying results. The RecommendationEngine is responsible for intelligent tutor ranking.

5 Class Description

5.1 User

This is the parent class for all system users.

Attributes

- userId
- name
- contactInfo

Methods

- constructors
- getters and setters
- viewProfile()

5.2 Tutor

This class stores tutor-specific details.

Attributes

- subjects
- experienceYears
- rating
- availableSlots

Methods

- addSubject()
- addAvailability()
- viewProfile()
- isAvailable()

5.3 Student

This class stores student-specific information.

Attributes

- requestedSessions
- sessionHistory

Methods

- viewProfile()
- requestSession()

5.4 TimeSlot

This class represents a tutor's available time slot.

Attributes

- slotId
- date
- time
- isBooked

Methods

- displaySlot()
- bookSlot()
- freeSlot()

5.5 Waitlist

This class manages students waiting for a particular slot.

Attributes

- waitingStudents

Methods

- addStudent()
- getNextStudent()
- isEmpty()
- displayWaitlist()

5.6 Session

This class represents a tutoring session between a tutor and a student.

Attributes

- sessionId
- tutorName
- studentName
- subject
- slotInfo
- status

Methods

- displaySession()
- cancelSession()

5.7 RecommendationEngine

This class provides tutor recommendation and ranking.

Methods

- calculateScore()
- recommendTutors()

5.8 Platform

This is the main managing class of the system.

Methods

- addTutor()
- addStudent()
- showAllTutors()
- searchTutorsBySubject()
- recommendTutors()
- bookSession()
- cancelSession()
- showAllSessions()

6 Smart Features Included

6.1 Tutor Recommendation and Ranking

The system recommends tutors instead of only listing them. Tutor ranking is based on:

- subject match
- tutor rating
- availability of requested slot

6.2 Waitlist Management

If a slot is already occupied, the student can be added to a waitlist for that slot.

6.3 Automatic Slot Reassignment

When a session is cancelled, the system checks the waitlist and automatically assigns the slot to the first waiting student.

6.4 Conflict Detection

The platform prevents double booking of the same tutor slot.

7 Prototype Functionality Implemented

The Milestone 2 prototype demonstrates the basic structure and core functionality of the platform. The implemented functionality includes:

- adding tutor profiles
- adding student profiles
- storing tutor subjects, ratings, and available slots
- viewing tutor and student profiles
- searching tutors by subject
- recommending tutors using ranking logic
- booking sessions
- handling full slots through waitlists
- cancelling sessions
- assigning a cancelled slot to the next student in the waitlist
- displaying all created sessions

The prototype is menu-driven and is designed to clearly show the core idea, structure, and intended workflow of the final project.

8 UML Class Diagram

The UML Class Diagram represents the architecture of the system and shows the classes, attributes, methods, and relationships used in the project.

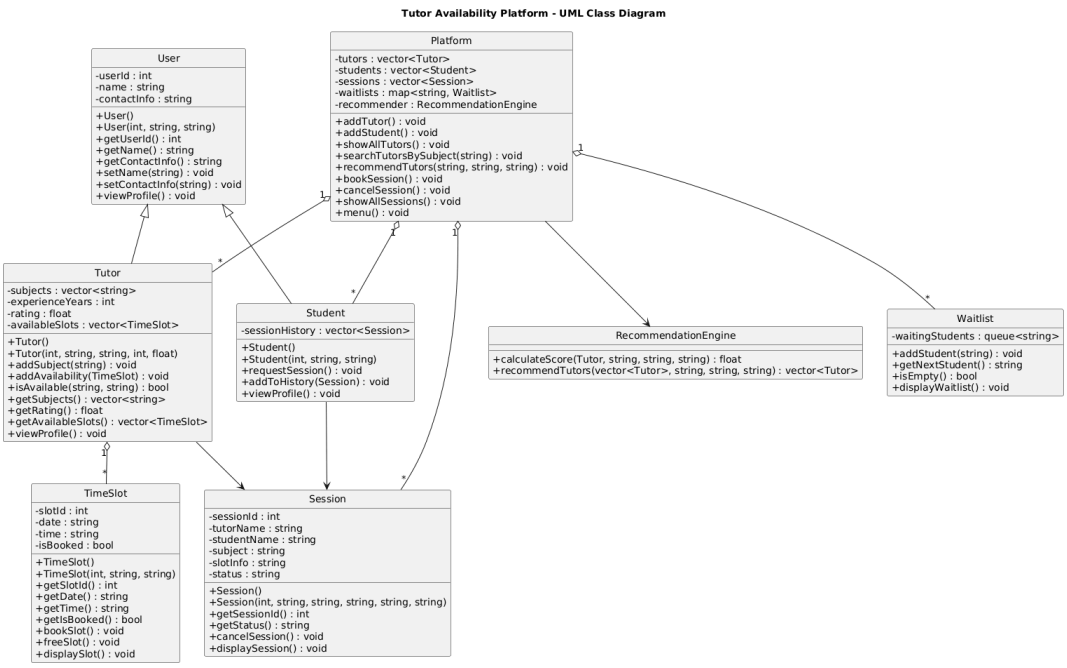

Figure 1: UML Class Diagram of Tutor Availability Platform

9 Test Cases

Test Case ID	Feature	Input	Output Confirms
TC-01	Add Tutor	Tutor name, contact, subject, rating, availability	3 tutor profiles created with subjects, rating, slots
TC-02	Add Student	Student name and contact details	3 student profiles created with contact info
TC-03	Search Tutors by Subject	Subject = Mathematics	Only Dr. Ali Raza and Ms. Sara Khan appear for ”Mathematics”
TC-04	Recommend Tutors	Subject = Physics, preferred slot = 4 PM	Mr. Usman Tariq ranks 1 for Physics at 4PM (subject match + available slot)
TC-05	Book Session	Student selects a tutor and an available slot	Session ID 1 created, Slot 1 changes from Available → Booked

TC-06	Conflict Detection	Another student requests the same booked slot	Zara and Hassan both get rejected and placed in the waitlist in order

Sample Output / Screenshots

```
TC-05: Book Session
--------------------------------------------------
  Input: Ahmed Malik books Dr. Ali Raza for Mathematics, Slot 1
  Session booked successfully!
  +----------------------------------------+
  Session ID   : 1
  Tutor        : Dr. Ali Raza
  Student      : Ahmed Malik
  Subject      : Mathematics
  Slot         : 2025-06-10 10:00 AM
  Status       : Scheduled
  +----------------------------------------+

  [Result] Session created and Slot 1 is now marked as Booked.

  Verifying slot status in Dr. Ali Raza's profile:

11 Conclusion

The Tutor Availability Platform is a practical Object Oriented Programming project that demonstrates core concepts such as inheritance, polymorphism, encapsulation, and association. In addition to profile and session management, it introduces smart decision-making through tutor recommendation and automated waitlist handling.

The Milestone 2 prototype establishes a strong design foundation for the final version of the project. It demonstrates not only the system structure and key class relationships, but also the main functional flows required for a scalable tutor scheduling platform.
